The overall trend is an increase in the Count of PM backlog work orders. Most of the sharp ups and downs in this chart are occurring at the beginning and end of the months, this is attributed to work around Emergency Light testing in Zones 1 and 2/3. This happens because these work orders have a target start date of the 1st of each month and get completed manually at the end, or after the end of the month, and by that time, they are > 30 days past the Target Start date of the 1st. The tailing up at the end of Q2 is due to holiday break when little work is done.
